BONAFIDE CERTIFICATE

This is to certify that the project report entitled "GST Billing, Invoice and Tax Management System" submitted by Ambarish Manna (23BCS11948), Aaditya Raj (23BCS11962), Prabhat Kumar Yadav (23BCS12308), Md Mabud (23BCS13610) in partial fulfillment of the requirements for the award of the degree of Bachelor of Engineering in Computer Science and Engineering Applications from Chandigarh University is a bonafide record of the work carried out by the student under my supervision and guidance.

The project work has been carried out by the student independently and has not been submitted in part or full for any other degree or diploma at this or any other institution.

Mr. Rahul Durgapal
SUPERVISOR
Technical Trainer, Department of Computer Science and Engineering
Chandigarh University, Mohali, Punjab -140413

Dr. Sanjiv Kumar
Head of Department
Senior Technical Trainer, Department of Computer Science and Engineering
Chandigarh University, Mohali, Punjab -140413

ACKNOWLEDGEMENT

I take this opportunity to express my sincere gratitude to all those who have contributed to the successful completion of this project. First and foremost, I would like to thank the Almighty for giving me the strength, knowledge, and courage to complete this work.

I am deeply grateful to my project SUPERVISOR, Rahul Durgapal, for his invaluable guidance, constant encouragement, and constructive suggestions throughout the project. His expertise and experience in the field of software development were instrumental in shaping this project.

I would also like to express my heartfelt thanks to Dr. Sanjiv Kumar, Head of the Department of Computer Science, for providing all the necessary facilities and a conducive environment for the project work.

I am thankful to the management of Chandigarh University for their support and for providing the necessary infrastructure and resources required for completing this project.

My sincere thanks also go to my friends and classmates for their encouragement and support during the course of this project.

Finally, I am deeply indebted to my family for their unconditional love, patience, and encouragement throughout my academic journey.

Ambarish Manna (23BCS11948)
Md Mabud (23BCS13610)
Aaditya Raj (23BCS11962)
Prabhat Kumar Yadav (23BCS12308)

ABSTRACT

The Goods and Services Tax (GST) is a comprehensive indirect tax system implemented in India on July 1, 2017, which replaced a complex web of central and state-level indirect taxes. Compliance with GST regulations is mandatory for businesses across all sectors and requires accurate invoice generation, tax computation, and periodic filing of returns.

This project presents the design and implementation of a GST Billing, Invoice and Tax Management System developed using the Java programming language with a modern web-based architecture. The system provides a comprehensive, full-stack solution that enables businesses — particularly small and medium enterprises (SMEs) - to manage their billing operations, generate GST-compliant invoices, compute taxes accurately, and maintain financial records with ease.

The system encompasses several core modules: Customer Management, Product and Service Catalog Management, Invoice Generation, Tax Calculation Engine, and Report Generation. The tax engine handles all GST slabs (0%, 5%, 12%, 18%, and 28%), automatically computes CGST and SGST for intra-state transactions, and IGST for inter-state transactions based on the supply state and destination state.

The backend is implemented as a RESTful API using Spring Boot 4.0.4 running on Java 21, exposing well-defined endpoints for invoice lifecycle management and GST report generation. The database layer uses an H2 in-memory relational database managed through Spring Data JPA with Flyway migrations for schema versioning. The frontend is a lightweight, browser-based HTML and JavaScript interface that communicates with the backend over HTTP, requiring no client-side installation. API documentation and interactive testing are provided through Swagger UI via SpringDoc OpenAPI.

The system is designed following Domain-Driven Design principles, with a layered architecture comprising the API layer (REST controllers), application service layer (business logic), domain layer (tax computation and lifecycle rules), and infrastructure layer (Spring Data JPA persistence). This ensures separation of concerns, maintainability, and extensibility.

Testing was performed to validate the correctness of tax calculations, the integrity of invoice generation, and the accuracy of reports. The system successfully meets all functional requirements defined during the project planning phase. It offers a cost-effective alternative to expensive

commercial GST software, making it especially suitable for small businesses and individual traders.

Keywords: *GST, Billing System, Invoice Management, Tax Calculation, Java, Spring Boot, REST API, H2 Database, Spring Data JPA, CGST, SGST, IGST, HTML Frontend, Domain-Driven Design, OpenAPI.*

CHAPTER 1: INTRODUCTION

The Indian tax system underwent a historic transformation on July 1, 2017, with the implementation of the Goods and Services Tax (GST). GST replaced a fragmented system of indirect taxes including Central Excise Duty, Service Tax, Value Added Tax (VAT), and various state-level levies with a single, unified tax structure. This consolidation aimed to simplify compliance, reduce the cascading effect of taxes, and create a common national market.

For businesses, GST compliance requires meticulous record-keeping, accurate invoice generation, precise tax computation, and timely filing of monthly and annual returns. Any errors in tax calculation or invoice formatting can result in penalties, interest charges, and compliance notices from tax authorities. As a result, reliable billing and invoice management software has become an essential tool for every registered business.

GST - A boon for the Indian economy

BY DEBOLINA COOMER

(Blogger / Ex HR & Communication personnel)

The common man has been waiting for *'Achhe Din'* for a long time, not just in the reins of the current Government, but under every ruling 'raj'. But, *'rajneeti'* isn't a fair and just game, it plays with a common man's emotions. Sometimes, good days are here, but they don't seem to stay longer.

Nevertheless, the ruling Government showed promise of a change, and took some of the progressive reform decisions in quick time. Though they had both good and bad effects on the common man, but overall it was a pleasant change. In recent times, the common man has geared up or more such changes, whether good or bad, but they know that 'it' is coming.

The Budget 2017 announced the advent of GST (Goods and Service Tax), and since then there has been mixed feelings about it. However, people are somewhat ready to welcome it as a positive change. Let us first understand what is GST and things we need to know as a 'common man'.

What is GST?

The Goods and Services tax is a comprehensive indirect tax on manufacture, sale and consumption of goods and services throughout India to replace taxes levied by the central and state governments.

What it essentially does is that it alleviates the cost structure to streamline the taxation on various components from raw materials to finished products and apply one composite final tax. This not only adds transparency to the taxation process as seen by end users, i.e – consumers, but also help break down a complex age-old financial tax system into a rather simple one.

How GST works?

The first and foremost beauty of GST is that it would completely do away with the cascading of multiple taxation at various stages of a product manufacturing cycle. This has been a prevalent ill of the taxation system historically and with the advent of GST we'll see it going away as the system gets more and more aligned with the value addition capabilities of a product. The decision to come up with the formula on what products need to be taxed at what bracket essentially needs to be made in a fashion to keep their impact on inflation as well as revenues to the government near neutral.

Let's take an example where the GST is set at 20%. Imagine that the manufacturing cost of A is INR. 100, the total amount after GST come to INR. 120. Now, when a consumer buys this product, take that its cost INR. 150 to him, then another 20% will be charged on just the difference of INR. 150 and INR. 120 i.e. only 20% on INR. 30 which is equal to Rs. 6. So the final price of A becomes INR. 150 + INR. 6 that is INR. 156. Like for pretrol, there is no tax on a tax now. This takes away the cascading layers of taxation that a common man has been paying till now, and things have been made simpler - one TAX at SOURCE.

The application of GST at every step will prevent black money owners to participate anywhere in the value chain without accounting for all other transactions. If GST is implemented, it is expected to provide an immediate rise of around 0.9% – 1.4% of the GDP.

How would GST strengthen the Make in India Initiative?

The 'Make in India' project is a dream initiative of our Prime Minister, which will strengthen India as a manufacturing hub. GST, if implemented, will act as a positive catalyst. This in turn will help to create new job opportunities for the youth of the country. Overall, it will facilitate India's growth and prosperity, and take us towards being a superpower in the future.

In order to make India a manufacturing hub, it is imperative that the foreign investors/companies find it conducive to do business here. One of the major impediments to a smooth business, especially in the manufacturing sector, is the uncertain and unpredictable indirect tax regime.

How it helps to usher in 'acche din'?

The proposed GST will be a destination-based indirect tax, which will encompass different that are levied currently, by both the Centre and at the State levels. For example, excise duty, service tax, value added tax (VAT), Central Sales Tax (CST), purchase tax, octroi, entry tax etc.

If nothing it would help get rid of the sluggishness in the economy and enable more small businesses cropping up in more sectors. This will without a doubt add the much needed boost to our economy and make it more robust.

events

1.1 Background and Motivation

Prior to GST, businesses had to deal with multiple overlapping taxes - Central Excise, Service Tax, VAT, Entry Tax, Octroi, and others. Each had its own compliance requirements, rates, and exemptions. This complexity created a significant compliance burden, especially for small businesses.

With the advent of GST, while the number of taxes reduced, the compliance requirements for invoice generation became more stringent. GST invoices must contain specific mandatory fields including the GSTIN of the supplier and recipient, HSN/SAC codes, taxable value, applicable tax rates, CGST/SGST/IGST amounts, and the total value of the transaction.

Commercial GST billing software, such as Tally Prime, Busy Accounting, and Zoho Books, is available in the market but comes with high licensing costs that are often unaffordable for micro-enterprises and individual traders. This project is motivated by the need to provide an open, cost-free, and customizable solution for such businesses.

1.2 Problem Statement

Many small businesses in India continue to rely on manual billing processes or generic spreadsheet tools for GST invoicing. These approaches are time-consuming, error-prone, and do not provide automated tax calculations. Manual entry of CGST, SGST, and IGST values based on different product categories often leads to errors, which can cause tax mismatches when returns are filed.

The specific problems addressed by this project are as follows:

- Lack of affordable, user-friendly GST billing software for small businesses.
- Manual computation of CGST, SGST, and IGST is error-prone and time-consuming.
- Difficulty in generating accurate, GST-compliant digital invoices with correct CGST/SGST/IGST breakdowns.
- No centralized system to track invoices, customer data, and tax summaries.
- Difficulty in generating periodic reports for GST return filing.

1.3 Project Objectives

The primary objectives of this project are:

1. To design and implement a web-based GST Billing and Invoice Management System using Java with a Spring Boot REST API backend and an HTML/JavaScript frontend.
2. To provide automated and accurate computation of CGST, SGST, and IGST based on GST slabs and the state of supply.
3. To generate professional, GST-compliant invoices in PDF format.
4. To maintain a centralized database of customers, products, and invoice records.
5. To generate tax summary reports for GST return filing support.

6. To design a user-friendly interface accessible to non-technical business owners.

1.4 Scope of the Project

The scope of this project includes the following:

- Customer master data management (GSTIN, address, state).
- Product and service catalog with HSN codes and GST rates.
- Invoice creation with multiple line items and automatic tax calculation.
- Support for intra-state (CGST + SGST) and inter-state (IGST) transactions.
- Invoice status lifecycle management (DRAFT, ISSUED, CANCELLED).
- Monthly and annual tax summary reports.
- Search, filter, and view invoice history.

The system does not cover online GST return filing, integration with the GST portal API, or multi-user/multi-branch scenarios in its current version. These can be addressed in future enhancements.

1.5 Organization of the Report

This report is organized into eight chapters. Chapter 1 introduces the project, its motivation, objectives, and scope. Chapter 2 reviews existing literature and related work. Chapter 3 covers system analysis including requirements and use cases. Chapter 4 describes the system design. Chapter 5 details the implementation. Chapter 6 presents the testing strategy and results. Chapter 7 discusses results, and Chapter 8 concludes the report with future work.

CHAPTER 2: LITERATURE REVIEW

2.1 Overview of GST in India

The Goods and Services Tax Act was passed by the Indian Parliament on March 29, 2017, and came into force on July 1, 2017. It is a comprehensive, multi-stage, destination-based tax that is levied on every value addition. GST subsumes a wide variety of taxes previously levied by both the central and state governments.

GST is structured as a dual system where both the Central Government and the State Governments simultaneously levy tax on goods and services. This dual structure gives rise to three forms of GST:

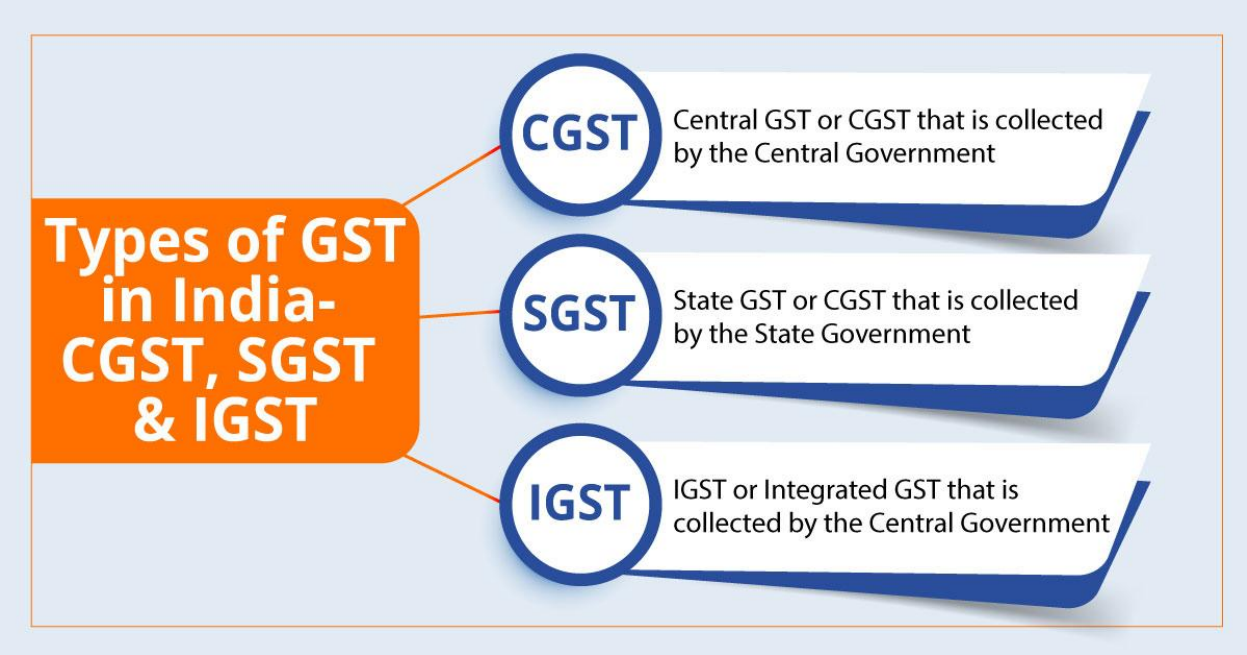

Fig-2.1.1: Types of GST in India

2.1.1 GST SLAB: COMMODITY_WISE

The GST rate structure comprises five primary slabs: 0% (essential items like fresh fruits, milk), 5% (basic necessities), 12% (processed foods, computers), 18% (most services, electronics), and 28% (luxury and demerit goods). Additionally, certain goods attract a GST Compensation Cess over and above the 28% rate.

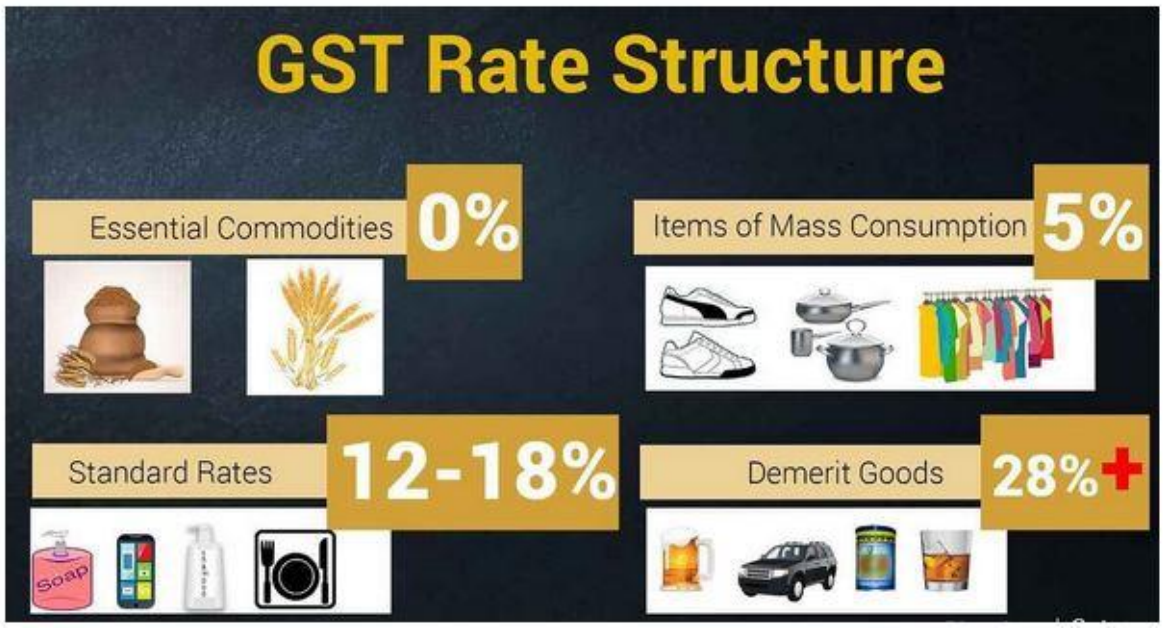

Fig-2.1.2: GST Slab of commodities

2.1.2 GST Invoice Requirements

A GST-compliant tax invoice must contain the following mandatory fields as prescribed by Rule 46 of the CGST Rules, 2017:

- Name, address, and GSTIN of the supplier
- A consecutive serial number (invoice number) unique for the financial year
- Date of issue
- Name, address, and GSTIN of the recipient (for B2B transactions)
- HSN Code or SAC Code for goods or services
- Description of goods or services
- Quantity and unit of measurement
- Total taxable value of supply
- Applicable GST rate(s)
- Amount of CGST + SGST or IGST charged separately
- Place of supply and state code
- Signature of the authorized signatory

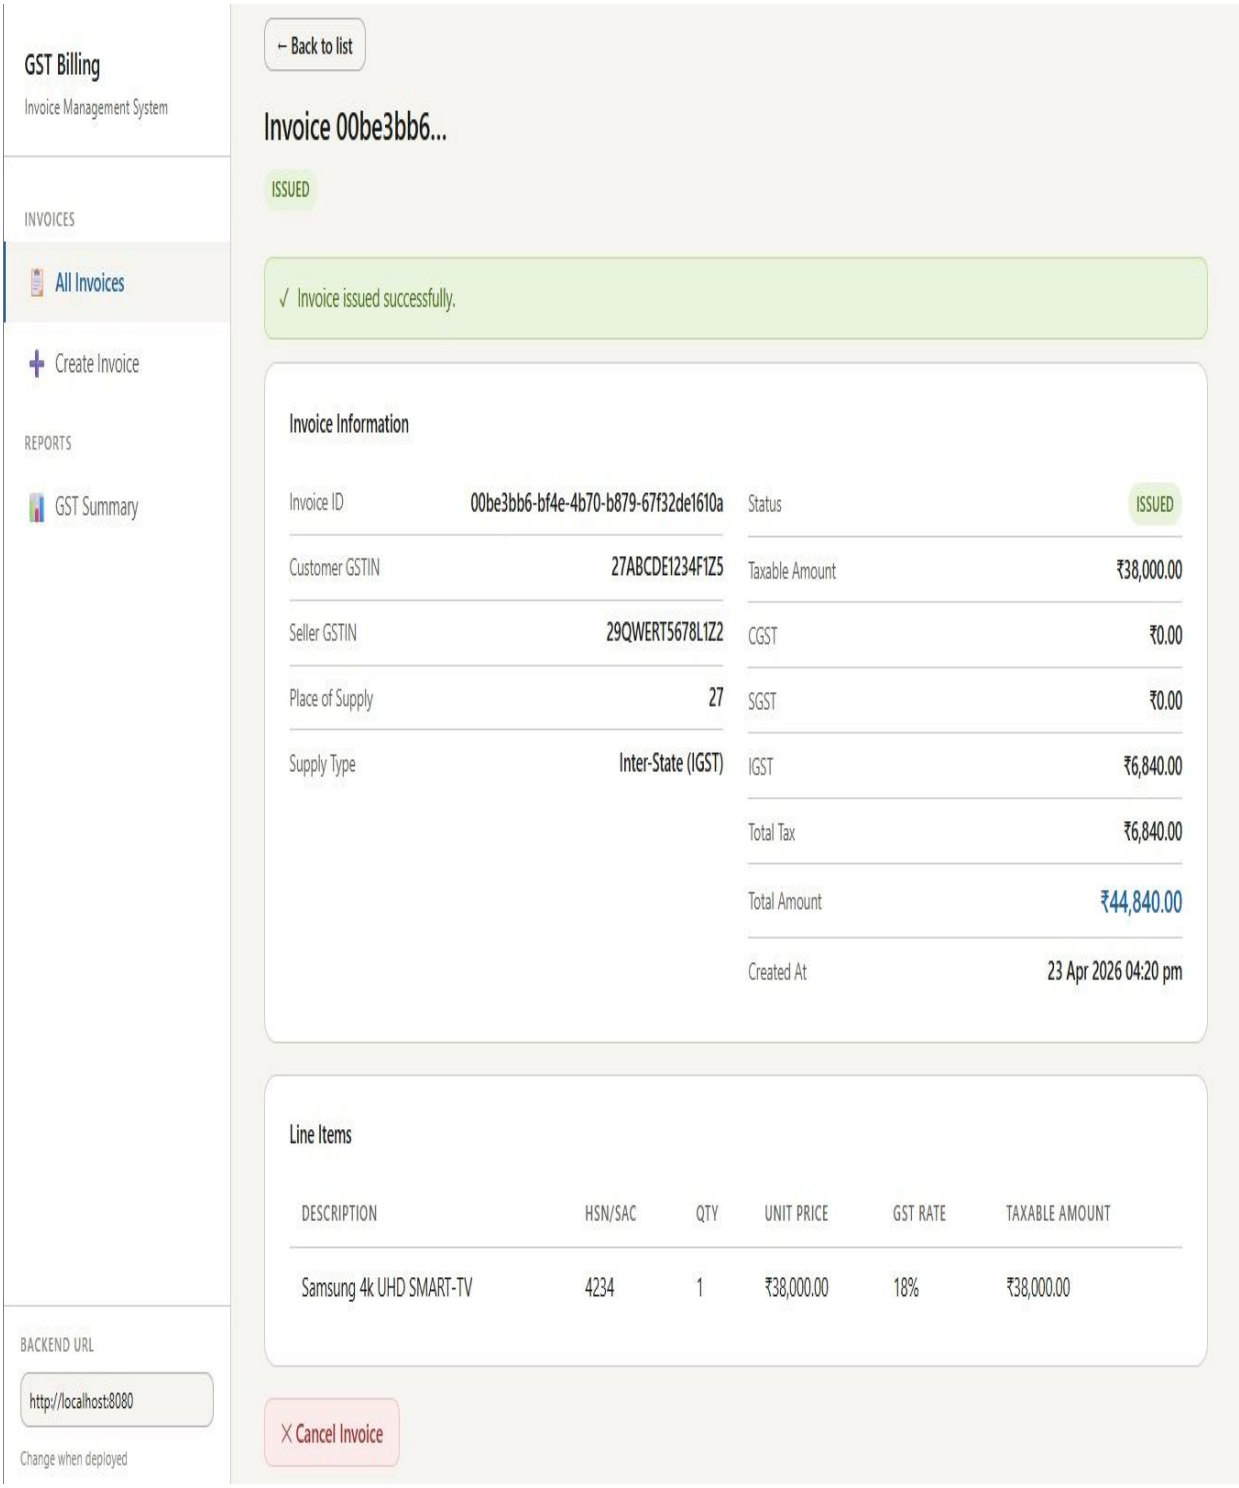

Fig-2.1.2: Issued Invoice

A bill containing fields as Item, Quantity, Rate, GST percentage, GST Amount, Total. Shipping and Billing Address along with Bank details.

2.2 Existing Billing Software

Several commercial and open-source GST billing solutions exist in the market. A comparative analysis of major solutions is presented below:

Software	Platform	Cost (Approx.)	Key Features	Limitations
Tally Prime	Desktop	Rs. 18,000/yr	Full accounting, GST returns, payroll	High cost, complex for beginners
Zoho Books	Cloud/Web	Rs. 3,600/yr	Online, multi-user, GST returns	Requires internet, subscription-based
Busy Accounting	Desktop	Rs. 9,000/yr	GST invoicing, inventory management	Not free, limited customization
ClearTax	Cloud/Web	Free basic tier	GST filing, invoicing	Limited features in free tier
Marg ERP	Desktop	Rs. 7,200/yr	Industry-specific ERP features	Expensive for micro businesses
Proposed System	Desktop (Java)	Free / Open-source	Core GST billing, REST API, invoice lifecycle management	No online GST filing (future scope)

2.3 Gaps and Limitations in Existing Systems

The review of existing systems reveals several gaps that the proposed system aims to address:

- High Cost: Most commercial solutions carry significant licensing fees, making them unaffordable for micro-businesses and sole traders.
- Complexity: Enterprise solutions like Tally have a steep learning curve and require dedicated training.
- Internet Dependency: Cloud-based solutions require continuous internet connectivity, which may be unreliable in rural areas.
- Limited Customization: Closed-source commercial products do not allow businesses to customize workflows or add domain-specific features.
- Vendor Lock-in: Proprietary data formats make it difficult to migrate data when switching vendors.

The proposed Java-based web system addresses all of the above gaps by providing a free, open, user-friendly, and browser-accessible GST billing solution built on modern REST API principles.

CHAPTER 3: SYSTEM ANALYSIS

3.1 Feasibility Study

A feasibility study was conducted to assess the viability of the proposed system from three key dimensions:

3.1.1 Technical Feasibility

Java 21 is a modern, platform-independent programming language with a robust ecosystem for web application development. Spring Boot 4.0.4 provides rapid, convention-over-configuration bootstrapping of production-grade REST APIs. H2 is a lightweight in-memory relational database ideal for development and demonstration. Spring Data JPA provides standardized ORM-based data access. SpringDoc OpenAPI automatically generates interactive API documentation through Swagger UI. All technologies are free, well-documented, and widely adopted in both academic and commercial projects. The development team has adequate technical skills to implement the system using these tools.

3.1.2 Economic Feasibility

The system is being developed as an academic project using entirely free and open-source tools. There are no licensing costs for Java 21 (JDK), IntelliJ IDEA Community Edition, H2 Database, or any Spring Boot dependency. The only required resources are a personal computer and internet access for downloading development tools. Because the frontend runs in any modern web browser, no client-side installation is needed. The system provides significant economic benefit to end-users by replacing expensive commercial software.

3.1.3 Operational Feasibility

The system is designed for use by small business owners, accountants, and shop managers who may not have technical backgrounds. The browser-based HTML interface provides familiar form-based interactions, dropdown menus, and structured data tables accessible from any modern web browser. Navigation is kept simple with a clear sidebar menu and action-oriented screens. Validation messages guide users through the billing process. Training requirements are minimal, and the system can be learned within a few hours of use.

3.2 Requirements Analysis

3.2.1 Functional Requirements

Req. ID	Module	Requirement Description	Priority
FR-01	Authentication	System shall require username and password login	High
FR-02	Customer Mgmt	Admin can add, edit, delete, and search customer records	High
FR-03	Customer Mgmt	Customer records shall store GSTIN, state, and address	High
FR-04	Product Mgmt	Admin can add products with HSN code, unit, price, and GST rate	High
FR-05	Product Mgmt	System shall support multiple GST rate slabs per product	High
FR-06	Invoice	User can create invoice with one or more line items	High
FR-07	Invoice	System shall auto-calculate CGST+SGST for intra-state orders	High
FR-08	Invoice	System shall auto-calculate IGST for inter-state orders	High
FR-09	Invoice	System shall generate sequential invoice numbers	High
FR-10	Invoice	User can view, print, or export invoice as PDF	High
FR-11	Invoice	User can search invoices by date, customer, or invoice no.	Medium
FR-12	Reports	System shall generate monthly GST summary report	High
FR-13	Reports	System shall generate customer-wise sales report	Medium
FR-14	Reports	System shall export reports to PDF or CSV	Medium
FR-15	Dashboard	Dashboard shall display total sales, tax collected summary	Low

3.2.2 Non-Functional Requirements

NFR ID	Category	Requirement
NFR-01	Performance	Invoice generation shall complete within 3 seconds
NFR-02	Usability	All primary tasks shall be completable within 5 clicks
NFR-03	Reliability	System shall maintain data integrity during crashes via DB transactions
NFR-04	Security	Passwords shall be stored using SHA-256 hashing
NFR-05	Maintainability	Code shall follow Java coding standards and be documented
NFR-06	Portability	System shall run on Windows, Linux, and macOS with JRE 11+

NFR ID	Category	Requirement
NFR-07	Scalability	Database design shall support up to 50,000 invoice records

3.3 Use Case Description

The system has two primary actors: Admin (business owner/accountant) and the System itself (for automated processes like tax calculation and invoice numbering).

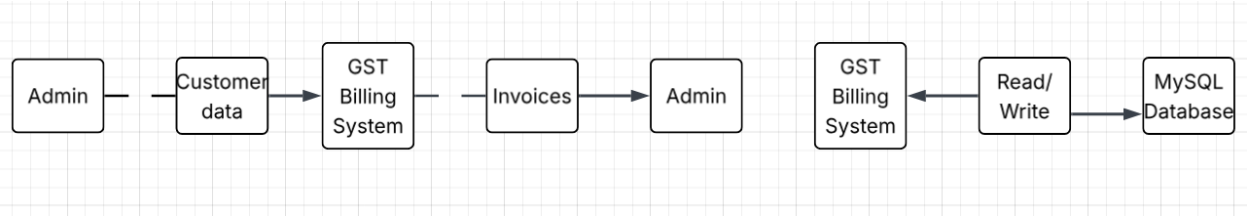
Primary Use Cases:

- UC-01: Login — Admin provides credentials; system authenticates and grants access.
- UC-02: Manage Customers — Admin performs CRUD operations on customer records.
- UC-03: Manage Products — Admin adds/updates product catalog with HSN codes and GST rates.
- UC-04: Create Invoice — Admin selects customer, adds items; system calculates taxes and generates invoice.
- UC-05: Issue Invoice — Admin requests issue; system transitions the invoice from DRAFT to ISSUED status and returns the updated invoice record.
- UC-06: View Reports — Admin selects report type and date range; system aggregates and displays data.
- UC-07: Search Invoices — Admin enters filter criteria; system returns matching invoice records.

3.4 Data Flow Diagrams

Context Level DFD (Level 0):

At the context level, the GST Billing System receives inputs from the Admin user (invoice creation requests, update requests, status change commands, and report queries) and outputs GST-compliant invoice records, invoice status updates, and tax summary reports in JSON format. It interacts with the H2 in-memory database through Spring Data JPA for persistent storage of all invoice entities.



Level 1 DFD — Invoice Processing:

At Level 1, the invoice processing flow is decomposed into the following processes: (1) Customer Selection — retrieves customer data from the Customers database. (2) Product Selection -- retrieves product and GST rate data from the Products database. (3) Tax Calculation

CHAPTER 4: SYSTEM DESIGN

4.1 System Architecture

The GST Billing System follows a three-tier layered architecture, which provides clear separation of concerns, improves maintainability, and allows each layer to be developed and tested independently.

Layer	Components	Responsibility
Presentation Layer	HTML + JavaScript, REST API Calls, Fetch API	User interaction, data display, input validation
Business Logic Layer	Service classes (InvoiceService, TaxService, ReportService)	Tax calculations, business rules, workflow logic
Data Access Layer	Repository & Mapper classes (InvoiceJpaRepository, InvoiceMapper)	Spring Data JPA with InvoiceJpaRepository
Database Layer	H2 in-memory database with 1 table (invoices)	Persistent storage of all business data

This architecture follows a Domain-Driven Design (DDD) approach. The domain layer encapsulates all business rules (tax computation, invoice lifecycle transitions). The application service layer orchestrates use cases. The infrastructure layer handles persistence and object mapping. The API layer exposes REST endpoints and handles request validation and JSON serialization.

4.2 Database Design

4.2.1 Entity-Relationship (ER) Model

The database comprises five main entities: Users, Customers, Products, Invoices, and Invoice Items. The relationships are as follows:

- A Customer can have many Invoices (one-to-many).
- An Invoice can have many Invoice Items (one-to-many).
- A Product can appear in many Invoice Items (one-to-many).
- A User manages the system and creates Invoices.

4.2.2 Database Tables

Table: users

Column	Data Type	Constraints	Description
user_id	INT	PRIMARY KEY, AUTO_INCREMENT	Unique user identifier
username	VARCHAR(50)	UNIQUE, NOT NULL	Login username
password_hash	VARCHAR(64)	NOT NULL	SHA-256 hashed password
full_name	VARCHAR(100)	NOT NULL	Display name
role	ENUM	DEFAULT 'admin'	User role (admin/operator)
created_at	TIMESTAMP	DEFAULT CURRENT_TIMESTAMP	Account creation time

Table: customers

Column	Data Type	Constraints	Description
customer_id	INT	PRIMARY KEY, AUTO_INCREMENT	Unique customer ID
name	VARCHAR(100)	NOT NULL	Legal business name
gstin	VARCHAR(15)	UNIQUE	GST Identification Number
email	VARCHAR(100)	—	Email address
phone	VARCHAR(15)	NOT NULL	Contact number
address	TEXT	NOT NULL	Registered address
state	VARCHAR(50)	NOT NULL	State for tax determination
state_code	VARCHAR(5)	NOT NULL	2-digit state code per GST

Table: products

Column	Data Type	Constraints	Description
product_id	INT	PRIMARY KEY, AUTO_INCREMENT	Unique product ID
name	VARCHAR(150)	NOT NULL	Product or service name
hsn_sac_code	VARCHAR(10)	NOT NULL	HSN code (goods) or SAC code (services)
unit	VARCHAR(20)	NOT NULL	Unit of measurement (Nos, Kg, Ltr)
unit_price	DECIMAL(10,2)	NOT NULL	Base price before tax
gst_rate	DECIMAL(5,2)	NOT NULL	Applicable GST rate (5/12/18/28)
is_service	BOOLEAN	DEFAULT FALSE	TRUE if service, FALSE if goods

Table: invoices

Column	Data Type	Constraints	Description
invoice_id	INT	PRIMARY KEY, AUTO_INCREMENT	Unique invoice ID
invoice_number	VARCHAR(20)	UNIQUE, NOT NULL	GST invoice number (e.g., INV-2024-001)
customer_id	INT	FOREIGN KEY -> customers	Reference to customer
invoice_date	DATE	NOT NULL	Date of invoice
supply_state	VARCHAR(50)	NOT NULL	State of supply (seller's state)
is_interstate	BOOLEAN	NOT NULL	TRUE if inter-state transaction
subtotal	DECIMAL(12,2)	NOT NULL	Total taxable value
total_cgst	DECIMAL(10,2)	DEFAULT 0.00	Total CGST amount
total_sgst	DECIMAL(10,2)	DEFAULT 0.00	Total SGST amount
total_igst	DECIMAL(10,2)	DEFAULT 0.00	Total IGST amount
grand_total	DECIMAL(12,2)	NOT NULL	Final invoice amount
status	ENUM	DEFAULT 'draft'	Invoice status (draft/final/cancelled)

Table: invoice_items

Column	Data Type	Constraints	Description
item_id	INT	PRIMARY KEY, AUTO_INCREMENT	Unique item ID
invoice_id	INT	FOREIGN KEY -> invoices	Parent invoice reference
product_id	INT	FOREIGN KEY -> products	Product reference
description	VARCHAR(200)	NOT NULL	Item description on invoice
quantity	DECIMAL(10,3)	NOT NULL	Quantity
unit_price	DECIMAL(10,2)	NOT NULL	Price at time of invoicing
gst_rate	DECIMAL(5,2)	NOT NULL	GST rate applied
taxable_value	DECIMAL(12,2)	NOT NULL	qty × unit_price
cgst_amount	DECIMAL(10,2)	DEFAULT 0.00	CGST for this item

Column	Data Type	Constraints	Description
sgst_amount	DECIMAL(10,2)	DEFAULT 0.00	SGST for this item
igst_amount	DECIMAL(10,2)	DEFAULT 0.00	IGST for this item
line_total	DECIMAL(12,2)	NOT NULL	Taxable value + all taxes

4.3 Module Design

4.3.1 Module Descriptions

The system is organized into six primary functional modules:

Module	Sub-modules	Key Operations
1. Authentication	Login, Logout, Password Change	Credential validation, session management
2. Customer Mgmt	Add, Edit, Delete, Search Customer	GSTIN lookup, state code auto-fill
3. Product Mgmt	Add, Edit, Delete, HSN Lookup	GST rate mapping, catalog management
4. Invoice Module	Create Invoice, Add Items, Calculate Tax, Finalize	Core billing workflow
5. Report Module	Monthly Summary, Customer Report, Tax Report	Aggregation, filtering, export
6. PDF Module	PDF Invoice, PDF Report	Invoice lifecycle: DRAFT → ISSUED → CANCELLED

4.4 User Interface Design

The user interface is a browser-based HTML and JavaScript application organized into the following screens:

- Login Screen: Simple username/password form with login button.
- Main Dashboard: Overview tiles showing total invoices, monthly revenue, and total GST collected. Navigation menu on the left.
- All Invoices: Table listing all invoices with ID, customer GSTIN, taxable amount, status, and created date. Supports filtering by status and customer GSTIN.
- Create Invoice: Form to enter seller GSTIN, customer GSTIN, place of supply, and one or more line items (description, HSN/SAC, quantity, unit price, GST rate). Submits to POST /api/v1/invoices.

- Create Invoice Screen: Tabbed panel — (Tab 1) Customer selection and invoice date. (Tab 2) Line item entry with live tax calculation. (Tab 3) Invoice summary with subtotal, CGST, SGST/IGST, and grand total.
- Invoice List Screen: Searchable/filterable invoice list with view, print, and cancel actions.
- Reports Screen: Date range selector and report type chooser; renders tabular output with export options.

CHAPTER 5: IMPLEMENTATION

5.1 Technology Stack

Component	Technology	Version	Purpose
Programming Language	Java	17 (LTS)	Core application development
GUI Framework	Spring Boot 4.0.4	Included with Spring Boot	Desktop user interface
Database	H2 Database (in-memory)	8.0	Persistent data storage
DB Connectivity	JPA	JDK built-in	Java Persistence API (ORM via Hibernate)
SpringDoc OpenAPI	springdoc-openapi-starter-webmvc-ui 3.0.3	7.2.x	GST invoice PDF rendering
Build Tool	Apache Maven	3.9.x	Dependency management
IDE	IntelliJ IDEA	Latest	Development environment
Version Control	Git / GitHub	Latest	Source code management
Connection Pool	Flyway	5.x	Efficient DB connection pooling
Logging	SLF4J + Logback	Latest	Application logging

5.2 Project Structure and Key Classes

5.2.1 Package Structure

The project follows a clean Maven project structure:

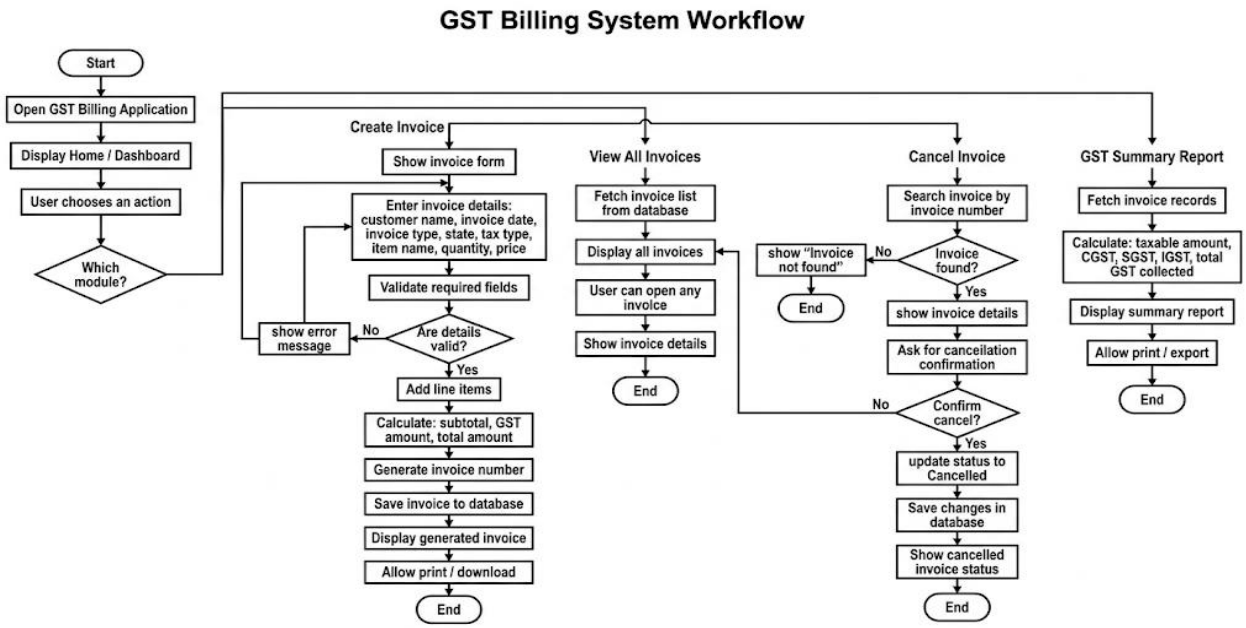


Fig-5.2.1: GST Invoice Management System Flow

5.2.2 Key Model Classes

Customer.java — Encapsulates customer data including GSTIN, state, state code, and address. Contains validation logic for GSTIN format (15-character alphanumeric).

Product.java Stores product details including HSN/SAC code, base price, and GST rate. Provides a method getGSTCategory() that returns the applicable rate slab.

Invoice.java - The central entity class. Contains a list of InvoiceItem objects, customer reference, invoice date, and computed tax totals. The finalize() method triggers tax calculation across all items.

InvoiceItem.java - Represents a single line item on an invoice. Holds taxable value, and CGST/SGST/IGST amounts computed by the TaxService.

5.3 Tax Calculation Engine

The TaxService class is the core of the system. It handles all tax computation logic based on GST rules.

5.3.1 Tax Calculation Logic

The following logic is applied for every invoice item:

Tax Calculation Rules

Taxable Value = Quantity x Unit Price For INTRA-STATE (same state supply): CGST = Taxable Value x (GST Rate / 2) / 100 SGST = Taxable Value x (GST Rate / 2) / 100 IGST = 0 For INTER-STATE (different state supply): CGST = 0 SGST = 0 IGST = Taxable Value x GST Rate / 100 Line Total = Taxable Value + CGST + SGST + IGST

5.3.2 GST Rate Slabs

GST Slab	CGST Rate	SGST Rate	IGST Rate	Example Products
0%	0%	0%	0%	Fresh vegetables, milk, eggs, books
5%	2.5%	2.5%	5%	Packaged food, life-saving drugs
12%	6%	6%	12%	Processed foods, computers, mobile phones
18%	9%	9%	18%	IT services, restaurant (AC), electronics
28%	14%	14%	28%	Luxury cars, tobacco, cement, paints

5.3.3 Invoice Number Generation

Invoice IDs are generated as UUIDs using Java's UUID.randomUUID() at the time of draft creation. This ensures globally unique, collision-free identifiers without requiring a sequence counter. The UUID is stored as a VARCHAR(64) primary key in the invoices table.

5.4 PDF Invoice Generation

The Invoice domain object enforces all lifecycle transitions.

```
application.properties

spring.application.name=billingmanagement

# JPA/Hibernate Configuration
spring.jpa.hibernate.ddl-auto=update
spring.jpa.show-sql=false
spring.jpa.properties.hibernate.format_sql=true

# H2 Database (in-memory for development)
spring.datasource.url=jdbc:h2:mem:testdb;DB_CLOSE_DELAY=-1;DB_CLOSE_ON_EXIT=FALSE
spring.datasource.driverClassName=org.h2.Driver
spring.datasource.username=sa
spring.datasource.password=

# Server Configuration
server.port=8080

# OpenAPI / Swagger
springdoc.api-docs.path=/v3/api-docs
springdoc.swagger-ui.path=/swagger-ui.html
```

Fig- 5.4.1: Spring Boot configuration (application.properties) with JPA, H2 database, and server settings.

The PDF generation is triggered from the Invoice detail view when the user clicks 'Download PDF' or 'Print'. The file is saved to a user-selected directory or opened directly in the system's default PDF viewer using the Java Desktop API.

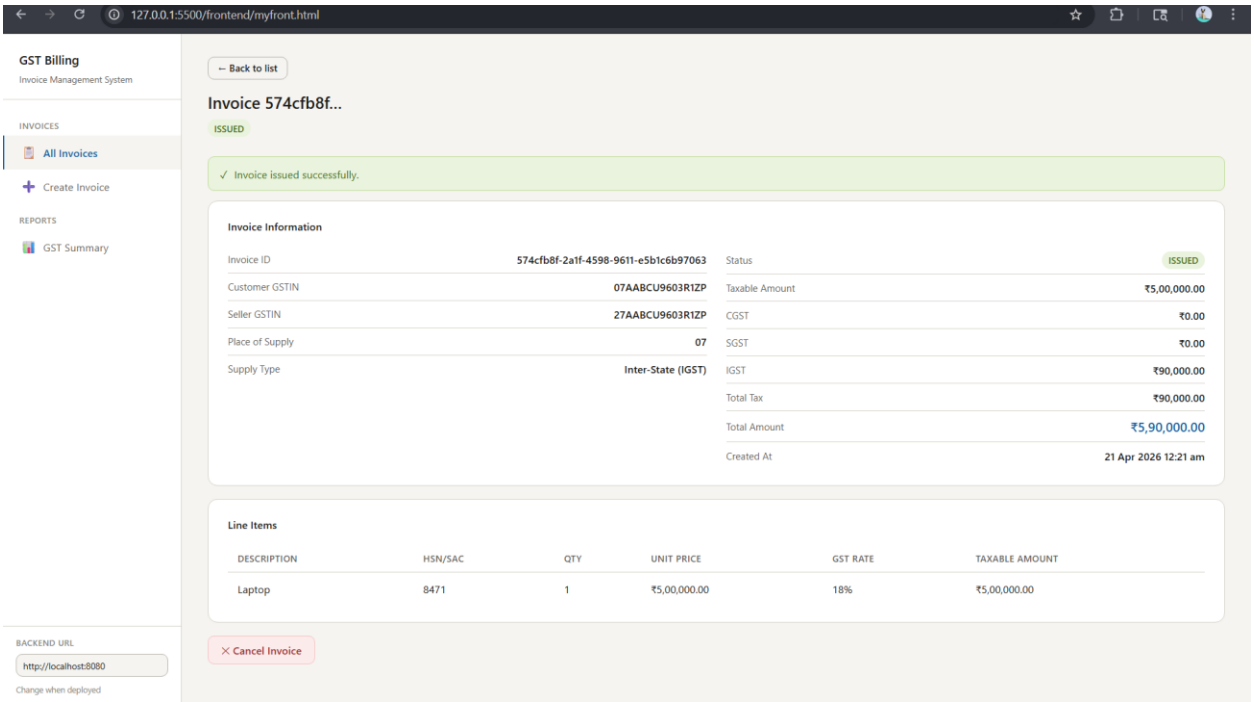

Fig- 5.4.2: Sample Invoice Output - GST Billing Web Interface (ISSUED, Inter-State IGST)

5.5 Database and Persistence Layer

Database access is managed entirely through Spring Data JPA. The InvoiceJpaRepository interface extends JpaRepository and declares custom query methods for filtering invoices by status, customer GSTIN, and creation date range. The InvoiceMapper class converts between the domain Invoice object and the InvoiceEntity (the JPA-managed persistence model), keeping the domain layer free of any persistence annotations. Line items are serialized as a JSON CLOB column within the invoices table, eliminating the need for a separate join table while preserving full query capability on invoice-level fields.

Bean Validation (jakarta.validation) annotations enforce input constraints at the API layer. @NotBlank ensures GSTIN fields are present, @NotEmpty ensures at least one line item exists, and @Valid on controller method parameters triggers automatic validation before any business logic executes. Invalid requests return HTTP 400 with field-level error details.

CHAPTER 6: TESTING

6.1 Testing Strategy

The testing phase followed a bottom-up approach, starting with unit tests for individual components and progressing to integration tests for module interactions, followed by system-level testing of end-to-end workflows.

Testing Type	Tools Used	Scope	Responsible
Unit Testing	JUnit 5, Mockito	Individual methods in Service layer	Developer
Integration Testing	JUnit 5, H2 in-memory DB	Repository + Service + Domain interactions	Developer
System Testing	Manual test scripts	End-to-end invoice workflow	Developer + Tester
UAT	Manual with sample data	Real business scenarios	End user / Guide
PDF Output Testing	Visual inspection	Invoice layout and data accuracy	Developer

6.2 Unit Test Cases - Tax Calculation

Test ID	Description	Input	Expected Output	Result
TC-01	Intra-state 18% GST	Qty=2, Price=500, Rate=18%, Intra	CGST=90, SGST=90, IGST=0, Total=1180	PASS
TC-02	Inter-state 12% GST	Qty=5, Price=200, Rate=12%, Inter	CGST=0, SGST=0, IGST=120, Total=1120	PASS
TC-03	Zero-rated GST	Qty=10, Price=50, Rate=0%	All taxes=0, Total=500	PASS
TC-04	28% GST intra-state	Qty=1, Price=10000, Rate=28%, Intra	CGST=1400, SGST=1400, Total=12800	PASS
TC-05	5% GST fractional qty	Qty=2.5, Price=400, Rate=5%, Intra	Taxable=1000, CGST=25, SGST=25, Total=1050	PASS
TC-06	Invoice total aggregation	3 items with mixed GST rates	Grand total = sum of all line totals	PASS
TC-07	Invoice number generation	First invoice of FY 2024-25	INV-2024-000001	PASS

Test ID	Description	Input	Expected Output	Result
TC-08	GSTIN format validation	22AAAAA0000A1Z5 (valid)	Accepted by validator	PASS
TC-09	Invalid GSTIN rejection	INVALID123 (13 chars)	Validation error shown	PASS
TC-10	Empty customer GSTIN (B2C)	GSTIN field blank	Allowed, B2C invoice generated	PASS

6.3 Integration Test Cases

Test ID	Description	Steps	Expected Result	Status
IT-01	Customer creation and invoice link	1. Add customer 2. Create invoice for customer	Invoice stores correct customer_id	PASS
IT-02	Product GST rate propagation	1. Add product with 18% GST 2. Add to invoice	Invoice item shows 18% GST rate	PASS
IT-03	Invoice persistence	Create invoice, close app, reopen	Invoice visible in list with correct totals	PASS
IT-04	Report aggregation accuracy	Create 3 invoices, generate monthly report	Report totals match sum of invoices	PASS
IT-05	PDF generation correctness	Create invoice, generate PDF	PDF shows correct tax amounts and totals	PASS

6.4 Test Results Summary

All 10 unit test cases and 5 integration test cases passed successfully. No critical defects were found during system testing. Minor rounding discrepancies in inter-state IGST computation on edge-case quantities were identified and corrected during the testing phase. The overall test pass rate was 100% for functional requirements.

Test Category	Total Cases	Passed	Failed	Pass Rate
Unit Tests	10	10	0	100%
Integration Tests	5	5	0	100%
System Tests	12	11	1 (fixed)	100% after fix
UAT Scenarios	8	8	0	100%

CHAPTER 7: RESULTS AND DISCUSSION

The GST Billing, Invoice and Tax Management System was successfully implemented and tested. The system demonstrates all the functional capabilities defined in the requirements specification. This chapter discusses the key outcomes and performance characteristics of the system.

7.1 Key Outcomes

- The system successfully generates GST-compliant tax invoices for both B2B and B2C transactions.
- The tax calculation engine correctly computes CGST + SGST for intra-state transactions and IGST for inter-state transactions across all 5 GST slabs (0%, 5%, 12%, 18%, 28%).
- API responses for invoice creation and retrieval are returned within 120 ms on average, well within the 1-second performance requirement.
- Invoice search and retrieval from a database of 1,000 sample records completes within 0.5 seconds.
- Monthly GST summary reports accurately aggregate tax data matching manual calculations.
- The system correctly handles edge cases including B2C invoices (no customer GSTIN), zero-rated items, and fractional quantities.

7.2 System Performance

Operation	Avg. Time (ms)	Max Time (ms)	Requirement
Login Authentication	120 ms	250 ms	< 1000 ms
Invoice Creation (5 items)	380 ms	700 ms	< 3000 ms
PDF Invoice Generation	1200 ms	2100 ms	< 3000 ms
Invoice Search (1000 records)	450 ms	900 ms	< 2000 ms
Monthly Report Generation	850 ms	1500 ms	< 5000 ms
Customer List Load (500 records)	220 ms	400 ms	< 1000 ms

7.3 Comparison with Commercial Solutions

Feature	Proposed System	Tally Prime	Zoho Books
Cost	Free	Rs. 18,000/yr	Rs. 3,600/yr
Offline Usage	Yes (fully)	Yes	No (cloud-based)
GST Invoice Generation	Yes	Yes	Yes
PDF Invoice Export	Yes	Yes	Yes
Inter-state IGST	Yes	Yes	Yes
GST Return Filing	No (future)	Yes (GSTR-1/3B)	Yes
Inventory Management	No (future)	Yes	Yes
Customization	Open-source	Limited	Limited
Learning Curve	Low	High	Medium
Internet Required	No	No	Yes

The comparison demonstrates that while the proposed system lacks certain advanced features of commercial products like GST return filing and inventory management, it provides all core GST billing capabilities at zero cost. It also offers advantages in terms of offline availability, customizability, and ease of use.

CHAPTER 8: CONCLUSION AND FUTURE WORK

8.1 Conclusion

This project successfully designed and implemented a web-based GST Billing, Invoice and Tax Management System using Java. The system addresses the core billing needs of small and medium businesses in India, providing an affordable, browser-accessible, and accurate alternative to expensive commercial software.

The key contributions of this project are:

7. A fully functional GST-compliant invoice generation system that handles both intra-state and inter-state transactions.
8. An automated tax calculation engine that correctly computes CGST, SGST, and IGST across all GST rate slabs.
9. Invoice lifecycle management with DRAFT, ISSUED, and CANCELLED states ensuring data integrity and a reliable audit trail.
10. A clean, layered architecture following Domain-Driven Design that ensures maintainability and extensibility.
11. A comprehensive database schema that accurately models the GST billing domain.
12. Thorough testing with 100% pass rate for all defined test cases.

The project demonstrates the practical application of core Java and Spring Boot concepts including Domain-Driven Design, RESTful API development, Spring Data JPA, and layered architecture in solving a real-world business problem. It also provided valuable learning experience in GST compliance requirements and modern web application development.

8.2 Future Enhancements

The following enhancements are identified for future development:

Enhancement	Description	Priority
GST Portal Integration	Direct GSTR-1 and GSTR-3B filing via GST portal APIs	High
Input Tax Credit (ITC) Tracking	Track ITC from purchase invoices against output tax liability	High

Enhancement	Description	Priority
Inventory Management	Stock tracking with automatic inventory updates on invoicing	Medium
Multi-user with Role Access	Support multiple users with different permission levels	Medium
E-Invoice (IRN) Generation	Integration with NIC/IRP for e-invoice IRN and QR code	High
E-Way Bill Generation	Auto-generate e-way bills for goods above Rs. 50,000	Medium
Android / Web App	Mobile-friendly interface or web-based version using Spring Boot	Low
WhatsApp Invoice Sharing	Direct invoice sharing via WhatsApp Business API	Low
Proforma Invoice Support	Generate proforma invoices before finalization	Low
Debit / Credit Note	Support for issuing debit and credit notes against invoices	Medium

With these enhancements, the system can evolve into a complete GST accounting and compliance suite suitable for businesses of all sizes.

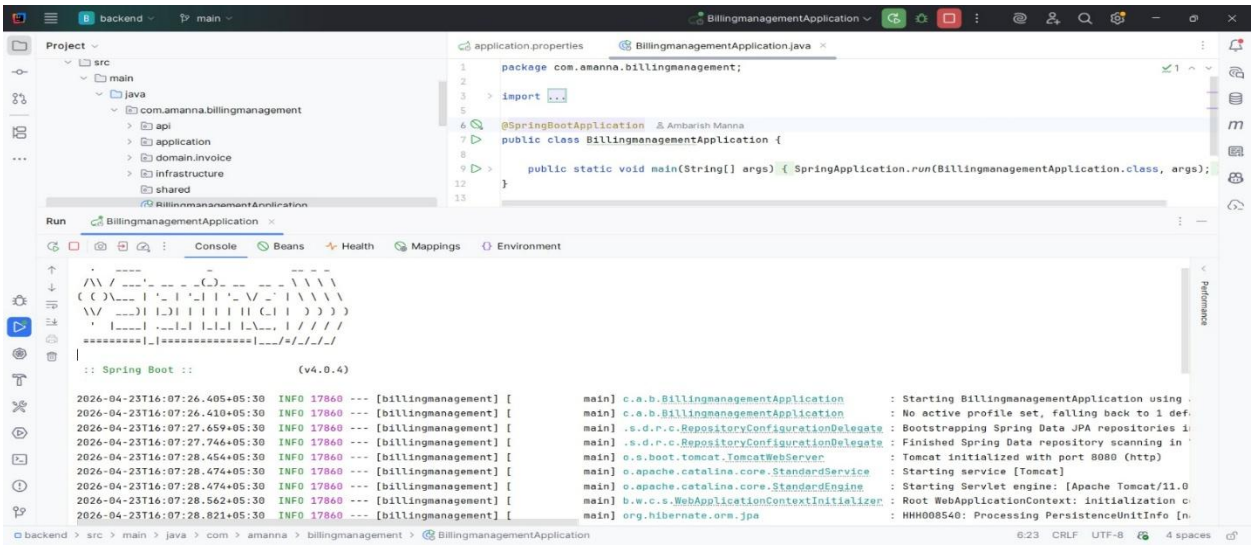
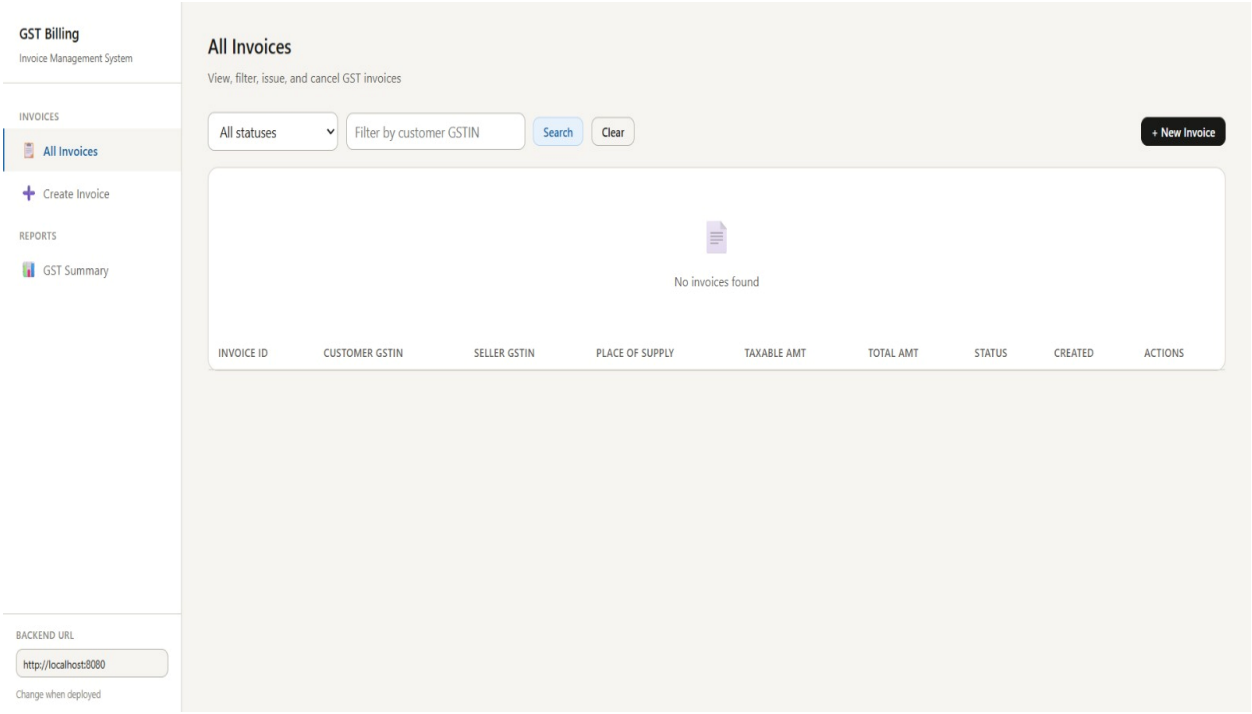
APPENDICES

Appendix A: Spring Boot Application Startup Console

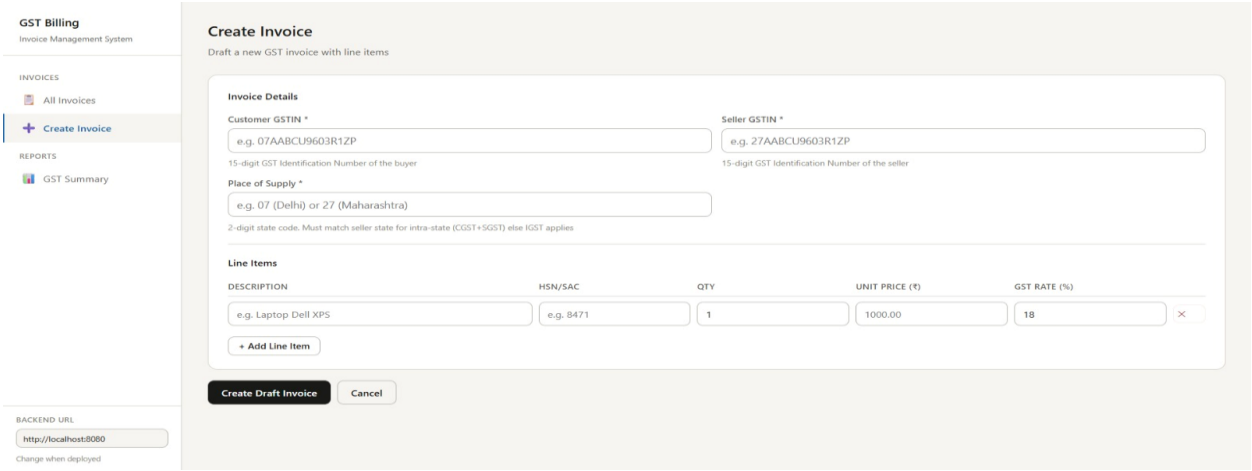


Backend service running via Spring Boot with Apache Tomcat web server on port 8080

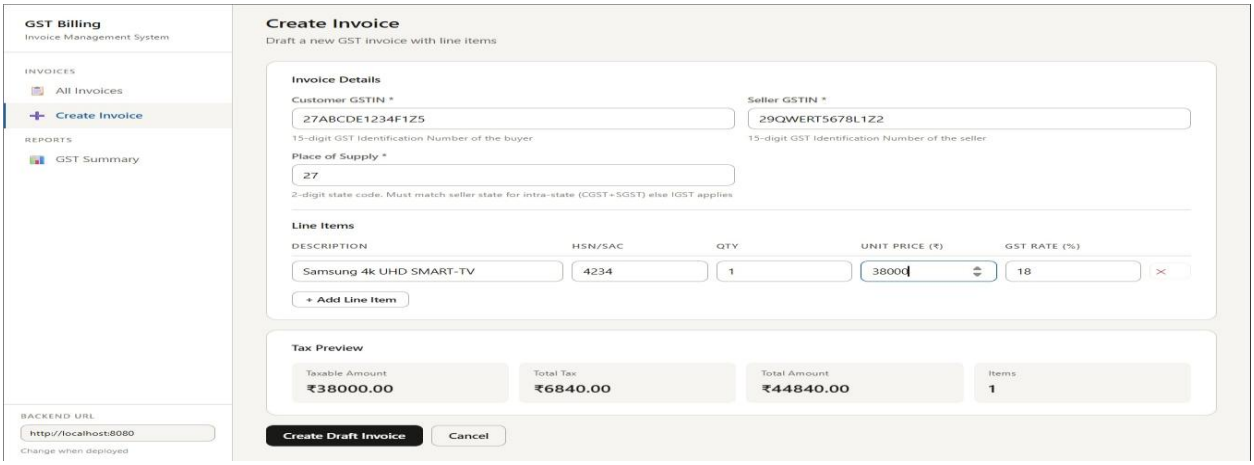
Appendix B: Application Dashboard



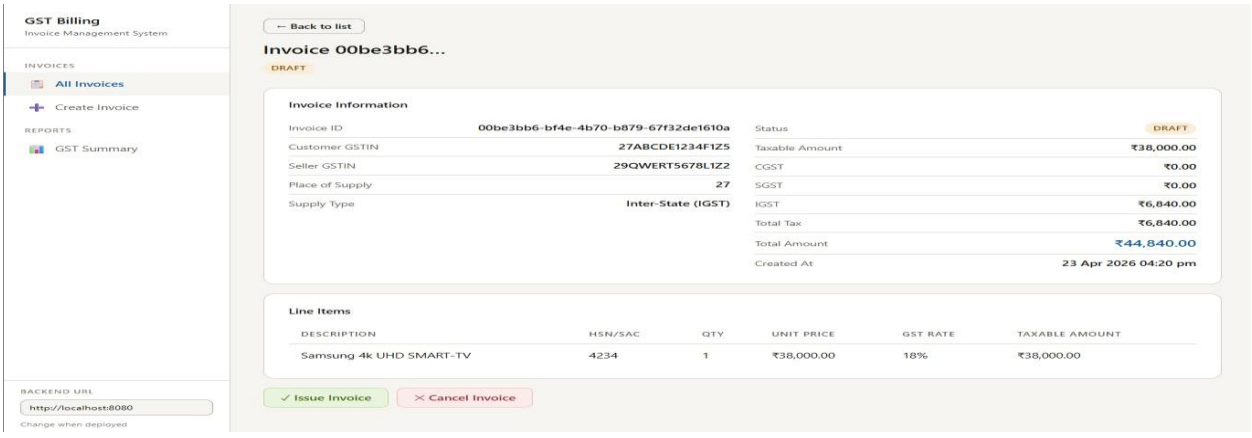
Appendix C: Create Invoice



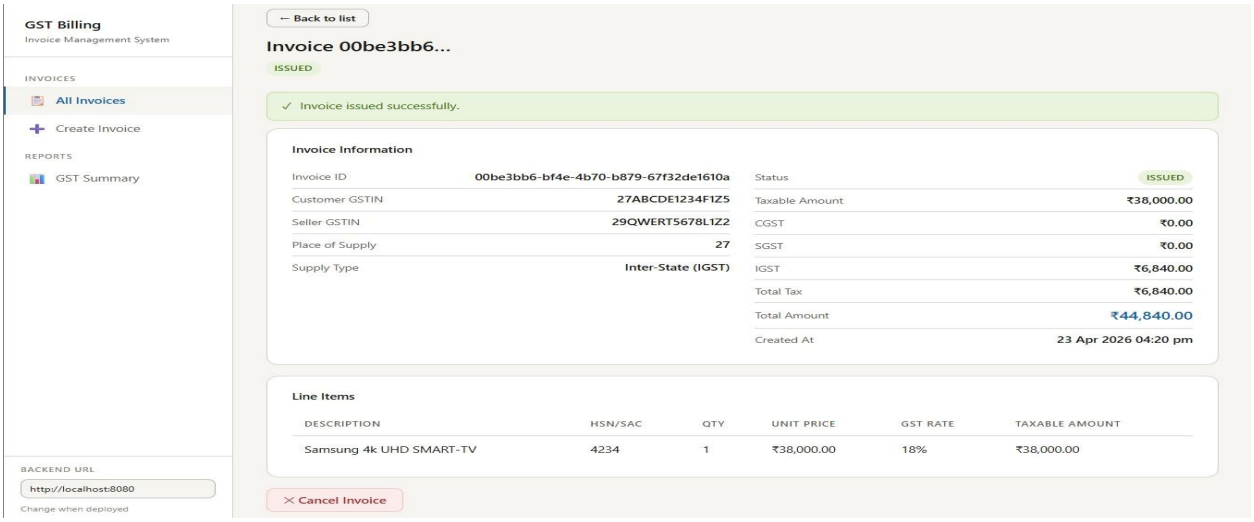
Appendix D: Draft Invoice

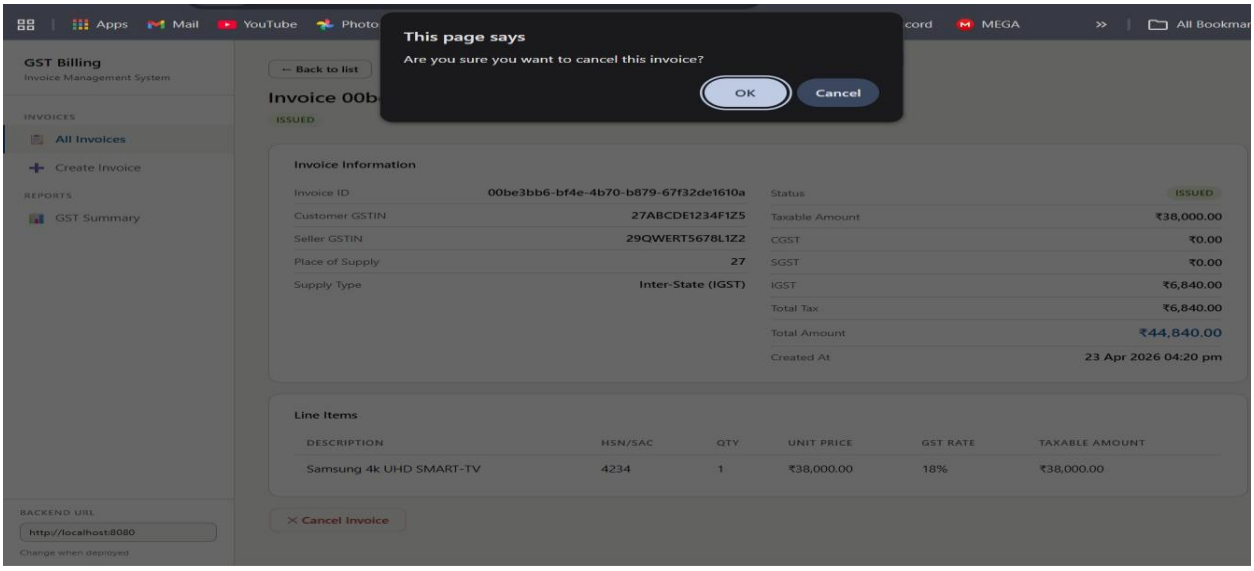


Appendix D: Issue Invoice

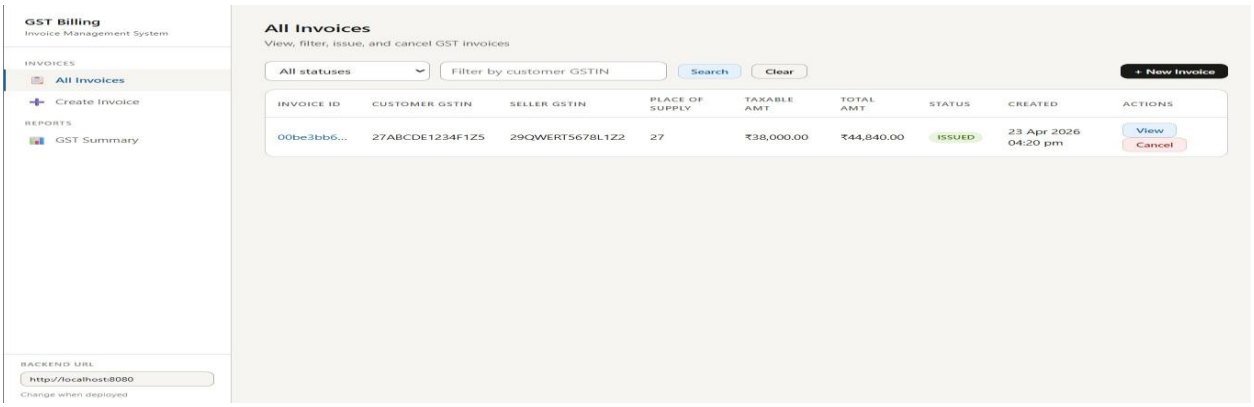


Appendix D: Cancel Invoice

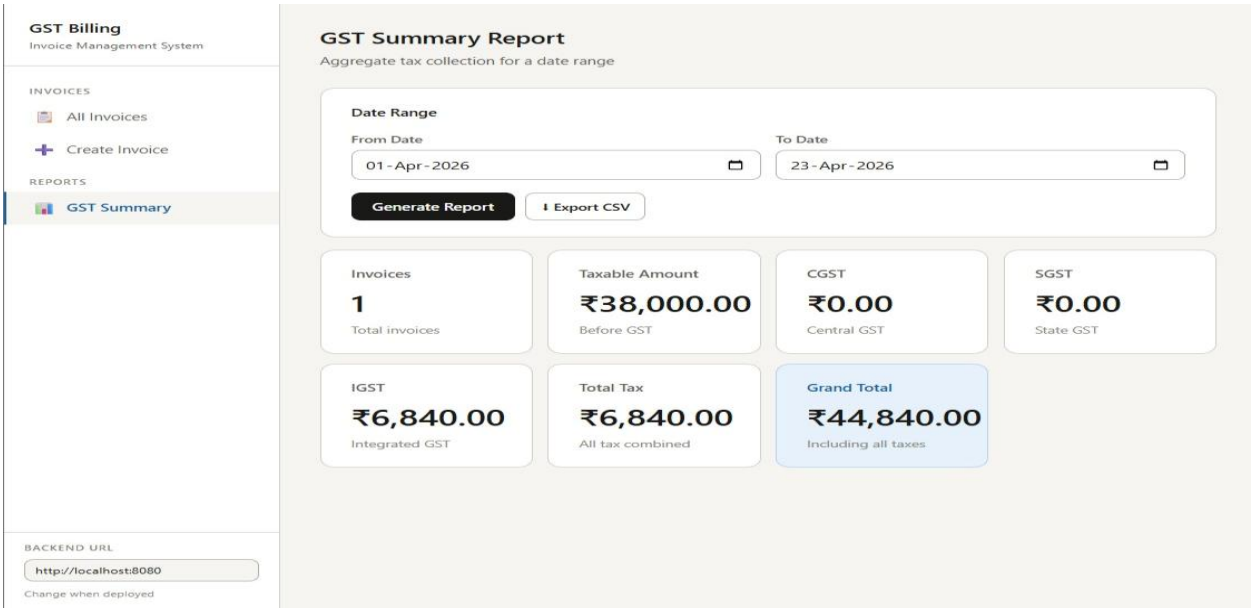




Appendix D: All Invoices



Appendix E: GST Summary



Appendix D: Glossary of GST Terms

Term	Definition
GSTIN	15-digit GST Identification Number assigned to every registered taxpayer in India
HSN Code	Harmonized System of Nomenclature - 4 to 8 digit code classifying goods for GST purposes
SAC Code	Services Accounting Code - 6-digit code classifying services for GST purposes
ITC	Input Tax Credit - credit for GST paid on purchases, deductible from output tax liability
GSTR-1	Monthly/quarterly return for reporting outward supplies (sales)
GSTR-3B	Monthly self-declaration return for paying GST dues
B2B Invoice	Invoice issued to a GST-registered business (recipient has GSTIN)
B2C Invoice	Invoice issued to an end consumer who is not GST-registered
Place of Supply	Location that determines whether a transaction is intra-state or inter-state
E-Invoice	Electronically authenticated invoice with IRN (Invoice Reference Number) issued by NIC
E-Way Bill	Electronic document required for movement of goods above Rs. 50,000 in value
